ABSTRACT

A system, method, and computer program for social mapping is provided. Data about a plurality of social network members is received. A first member of the plurality of social network members is allowed to identify a second member of the plurality of social network members with whom the first member wishes to establish a relationship. The data is then sent to the second member about the first member based on the identification. Input from the second member is received in response to the data. The relationship between the first member and the second member is confirmed based on the input in order to map the first member to the second member.

MAPPING RELATIONSHIPS BETWEEN MEMBERS IN A SOCIAL NETWORK

CROSS-REFERENCE TO RELATED APPLICATIONS

The present application claims the benefit and priority of U.S. provisional patent application Ser. No. 60/750,844 filed on Dec. 14, 2005 and entitled "Systems and Methods for Social Mapping," which is herein incorporated by reference.

BACKGROUND OF THE INVENTION

1. Field of the Invention

The present invention relates generally to social networking, and more particularly to systems and methods for social mapping.

2. Description of Related Art

Conventionally, people have networked with one another by joining social clubs, attending social events, meeting friends through other friends, and so forth. The Internet has made keeping in touch with friends and acquaintances more convenient for many people. For other people, the Internet provides a social forum for networking and meeting new people.

For many people, the Internet more recently represents the principal way in which people meet new friends and remain in touch with existing friends. Thus, the Internet provides a medium for a complex array of interactions between vast numbers of individuals.

In order to facilitate communications between the vast numbers of individuals, various social networking websites have developed in recent years. Social networking websites can provide organizational tools and forums for allowing these individuals to interact with one another via the websites. However, many users are leery about providing information via the Internet. Many users prefer to limit communications to specific groups of other users, for example.

SUMMARY OF THE INVENTION

The present invention provides a system, method, and computer program for social mapping. Data about one or more social network members is received. A first social network member is allowed to identify at least one second social network member to establish a relationship. Data about the first social network member is then sent to the second social network member based on the identification. Input from the second social network member is received in response to the data. The relationship is confirmed based on the input in order to map the first social network member to the second social network member.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 illustrates a schematic diagram of an exemplary environment for social mapping;

FIG. 2 illustrates a block diagram of an exemplary social network engine;

FIG. 3 illustrates an exemplary display page associated with the social network engine;

FIG. 4 illustrates an exemplary social editor page associated with the social network engine; and

FIG. 5 illustrates a flow diagram of an exemplary process for social mapping.

DETAILED DESCRIPTION

FIG. 1 illustrates a schematic diagram of an exemplary environment for social mapping. One or more users **102**, such

2

as a user A **102A**, a user B **102B**, and a user N **102N**, are in communication via a network **104** with a social network engine **106**. The social network engine **106** may comprise a social networking website, one or more servers operating the social networking website, or any other device or application capable of providing social networking services via the network **104**. The users **102** can access the services provided by the social network engine **106** via the network **104**. Optionally, one or more of the users **102** may be able to access the social network engine **106** directly.

The users **102** can access the social network engine **106** via a computing device, such as a laptop or desktop computer, a cellular telephone, a personal digital assistant (PDA), a set top box, and so forth. The users **102** can view data about social network members via the social network engine **106**, enter data about themselves and possibly others, join social network groups, and so forth. The users **102** are typically members of a social networking website associated with the social network engine **106**, for example, and thus comprise the social network members.

According to exemplary embodiments, a user **102**, such as the user A **102A**, identifies one or more other members associated with the social network engine **106**, such as the user B **102B** and the user N **102N**, with which the user A **102A** wants to build a relationship or establish or alter the details of an existing relationship. Via the social network engine **106**, the user A **102A** enters the details about the relationship. The social network engine **106** then sends the data, such as the data comprising the details from the user A **102A** to the other users (i.e., user B **102B** and user N **102N**). The user B **102B** and the user N **102N** then provide input in response to the data. The response may, for example, modify the data.

The relationship with the user B **102B** and the user N **102N** is confirmed, based on the input, by the social network engine **106**. The confirmation may include denying the existence of the relationship, according to some embodiments. Any type of confirmation and/or input may be utilized to alter and/or establish the relationship between the user A **102A** and the user B **102B** and the user N **102N**.

The relationship may comprise any type of relationship that exists between two of the users **102**. For example, the user A **102A** and the user B **102B** may have worked together, been classmates, be related, have dated, and so forth. More than one relationship may exist between the two users. For example, the user A **102A** and the user B **102B** may have both worked together and dated. Processing, accessing, utilizing, modifying, and so forth the relationship data between two or more users is discussed further in association with FIGS. 2 through 5.

Referring now to FIG. 2, a block diagram of an exemplary social network engine, such as the social network engine **106** discussed in FIG. 1, is illustrated. A communications interface **202** is provided in association with the social network engine **106** for receiving data from and sending data to the users **102**. The users **102** can send any type of data to the social network engine **106** via the network **104** and vice versa.

Typically, the users **102** access a website associated with the social network engine **106**. For example, the social network engine **106** may host a social networking website where the users **102** can visit to interact with one another. The website can display various types of data about the users **102** to one another, such as profile information, or relationships a particular user, such as the user A **102A**, has with other users, such as the user B **102B** and the user N **102N**. The users **102** may belong to particular communities within the social net-

working website, such as communities categorized according to school attended, workplace, geographical location, and so forth.

A social relationship editor module **204** is provided for editing the social relationships that the users **102** have with one another. For example, the user A **102A** can specify a particular relationship with the user B **102B** and the user N **102N**. The user B **102B** and/or the user N **102N** may then be asked to confirm the particular relationship specified by the user A **102A**. Accordingly, each relationship established via the social networking website is verified by two or more of the users **102** in the relationship. A social relationship editor display page associated with the social relationship editor module **204** is discussed further in association with FIG. 3.

The social relationship editor module **204** can track the one or more relationships between the users **102**. The social relationship editor module **204** can also generate and send communications to the users **102** to confirm the relationships identified. As discussed herein, the users **102** are typically members of the social networking website. Accordingly, the users **102** interact with one another via the social network website associated with the social network engine **106** and can identify relationships with one another in order to facilitate the interactions, or for any other reason.

A relationship storage module **206** is provided for facilitating storage of the relationships between the users **102**. The relationship storage module **206** can utilize any type of storage device or medium to store the various relationships. For example, the relationship storage module **206** can store the relationships in databases, on CD ROMS, in DRAM, and so forth. Any type of storage device or storage medium for storing the relationships, profile data associated with the users **102**, or any other information associated with the users **102**, is within the scope of various embodiments.

A relationship display module **208** is also provided in association with the social network engine **106**. The relationship display module **208** identifies the relationships between the users **102** and generates a display page that indicates profile information, relationships, and other data about the users **102**. For example, the user A **102A** may be able to request, via a button, portal, link, and so forth, a display page regarding people from a particular community associated with the user A **102A**, such as a college community. The relationship display module **208** can then generate and display data about the users **102** belonging to the particular community associated with the user A **102A** to the user A **102A**. The user A **102A** can then utilize the display page to access more detailed data about each of the users **102** listed on the display page. The relationship display module **208** may display any data about the users **102** associated with the social networking site.

Although FIG. 2 shows various modules associated with the social network engine **106** (e.g., the communications interface **202**, the social relationship editor module **204**, the relationship storage module **206**, and the relationship display module **208**), fewer or more modules may be associated with the social network engine **106** and still fall within the scope of various embodiments. For example, a database (not shown) may be coupled to the social network engine **106** for storing data about the users **102**.

FIG. 3 illustrates an exemplary social network display page **300** that may be associated with the social network engine **106**. The social network display page **300** includes a pictorial/graphical representation **302** for each of the users **102**. For example, the user A **102A** may utilize a photo of the user A **102**, while the user B **102B** may utilize a cartoon character to represent the user B **102B**. Any type of picture, photo,

graphic, icon, symbol, and so forth may be utilized to represent the users **102** via the pictorial/graphical representation **302**.

Biographical data **304** is displayed about each of the users **102** that are listed. For example, the name, status, year of graduation, field of study, and so forth may be displayed as the biographical data **304** for each of the users **102**. Any type of data may comprise the biographical data **304**.

A user action area **306** may be associated with the social network display page **300**. For example, the user action area **306** may be displayed in association with each of the users **102**. In FIG. 3, the user action area **306** is displayed to the right of the biographical data **304** for each of the users **102**. However, the user action area **306** may be displayed anywhere. For example, the pictorial/graphical representation **302** may be accessed, check-marked, highlighted, and so forth in order to display the user action area **306**.

The user action area **306** allows the users **102** to select one or more actions to perform in association with a particular user, such as the user A **102A**, about which the biographical data **304** is being viewed. For example, the users **102** can choose to send the users **102** an email or other message via the “send message” function, or to utilize a “poke her!” function to be directed to a pop-up or similar screen, confirming that the user **102** wishes to “poke” a displayed user. An announcement may be sent to the displayed user informing the displayed user that the displayed user has been “poked” by another user **102**.

The user action area **306** may also allow the users **102** to utilize a “view friends” function in order to view the data about friends of the users **102**, to utilize a “view photos” function to view photos associated with the user, and/or an “add to friends” function to request addition to a friends group of the user **102**. Various other options may be accessed via the user action area **306**. For example, the users **102** may be able to access stories about a particular user, such as the user B **102**, via the user action area **306**.

The social network display page **300** may be utilized for displaying any type of data about the users **102**. The social network display page **300** shown in FIG. 3 is an exemplary display page for displaying various users belonging to a community. Display pages may also be utilized to display profile data about individual users or groups of users, to display data about the users **102** belonging to various communities, to display stories about the users **102**, and so forth. The social network display page **300** in FIG. 3 may be utilized, according to exemplary embodiments, to identify and/or select the users **102** known to a particular user, such as the user A **102A** with whom the user B **102B** wants to establish a relationship. The social network display page **300** may be generated by the relationship display module **208** and be displayed in response to a search or filter function initiated by the user A **102A**, such as a search performed. As discussed herein, the data about the users **102** for the social network display page **300** may be stored in a database, cache memory, or any other memory utilized by the relationship storage module **206** or another storage module (not shown) for storing data about the users **102**.

According to some embodiments, the social network display page **300** may be utilized to display a directory of the users **102**, a collection of the users **102**, a directory of established relationships associated with the user A **102A**, for example, and so forth. As discussed herein, any of the data associated with the users **102** may be displayed utilizing the social network display page **300** or any other display mechanism associated with the social network engine **106**.

FIG. 4 illustrates an exemplary social editor page associated with the social network engine 106. The social editor page 400 illustrated in FIG. 4 can be utilized to question the users 102 about the relationships with other user 102 associated with the social networking website. The social editor page 400 may be sent in response to a request from a particular user, such as the user A 102A, to form or otherwise establish a relationship with another user, such as the user B 102B, for example.

A social editor inquiry 402 may be utilized to establish the subject matter for the social editor page 400. For example, FIG. 4 illustrates the social editor page 400 for the social editor inquiry 402 "How do you know John Do?" However, the social editor inquiry 402 may comprise any inquiry, such as "Is the information provided by John Do about your relationship accurate?" Any type of social editor inquiry 402 may be provided in association with the social editor page 400.

A relationship type identifier 404 may be displayed for allowing a user 102 to select and/or identify the relationship the user 102 has with other users 102. For example, the user A 102A may select that the user A 102A lived with the user B 102B, worked with the user B 102B, and/or knows the user B 102B through a friend. One or more of the relationship identifiers 404 may be selected. As discussed herein, the users 102 may know each other via more than one means.

A relationship details identifier 406 allows the users 102 to further specify the nature of the relationship. For example, the relationship details identifier 406 may establish where the users 102 lived together, where the users 102 worked together, which friends the users 102 have in common, and so forth. Although only one relationship details identifier 406 is illustrated, more than one relationship details identifier 406 associated with each of the relationships may be provided.

A timeframe identifier 408 may also be provided in association with the social editor page 400. The timeframe identifier 408 may be utilized to establish a time or timeframe associated with the relationship identifier 402. For example, the timeframe identifier 408 can specify when the users 102 lived together, worked together, dated, and so forth.

The relationship identifier 402, the relationship type identifier 406, the relationship details identifier 406, and/or the timeframe identifier 408 may be selectable via a drop down menu, a text entry box, a check box, and/or via any other selection method or combination of selection methods. According to exemplary embodiments, the social editor inquiry 402 is pre-populated with selections when sent to the users 102 with whom confirmation of the relationship is sought. Further, the social editor page 400 can be automatically populated, partially or wholly, utilizing data already stored about the users 102 and/or the relationship the users 102 have established with one another on previous occasions.

The arrangement, presentation, display, and/or subject matter described in connection with FIGS. 3 and 4 may vary and still remain within the scope of various embodiments. For example, additional relationship questions may be utilized in association with the social relationship page 400 or additional types of the biographical data 304 may be displayed via the social network display page 300.

For example, the user A 102A can complete the social editor page 400 by selecting from the relationship identifier 402, the relationship type identifier 404, the relationship details identifier 406, the timeframe identifier 408, and/or any other identifiers that may be provided via the social editor page 400, in order to provide details about the relationship the user A 102A has with the user B 102B, for example. The user B 102B can then be sent the pre-populated social editor page 400 and asked to confirm the data provided by the user A

102A. The user B 102B can confirm the accuracy of the data on the social editor page 400, modify the data on the social editor page 400, add to the data on the social editor page 400, and/or deny the accuracy of the data on the social editor page 400.

The details about the relationship established via the social editor page 400 can be stored by the relationship storage module 206. For example, a relationship database (not shown) may be utilized to map the relationships between the users 102 associated with the social network engine 106. The map can show a network of the relationships between the users 102, in one instance.

The subject matter of the inquiries and the data associated with the social editor page 400 may include any topics, such as membership in a club, a team, a church, etc.; common courses, classes, institutions, programs of study, etc.; common travels, journeys, adventures, parties, conferences, etc.; common familial relationships, friends, acquaintances, romantic partners or interests, musical interests, restaurants, bars, pubs, etc.; whether two or more of the users 102 met randomly, accidentally, purposefully, via online activities, etc.; and/or whether two or more of the users 102 have never met, etc. Any type of data can be established via the social editor page 400, as discussed herein.

As discussed herein, a confirmation request can be sent to the users 102 in response to completion of the social editor page 400. The social relationship editor module 204 can send a communication, for example, to the user B 102B that the user A 102A selected the user B 102B as a person the user A 102A may know or with whom the user A 102A wishes to establish a relationship. The user B 102B can elect to confirm the data provided by the user A 102A, adjust or edit the data, send a message to the user A 102A regarding the relationship, deny the existence of the relationship, add data about the relationship; and so forth. If the user B 102B edits or adds to the data, the user A 102A may be asked to confirm the added or edited data, according to exemplary embodiments.

The users 102 can view the status of the relationships with other of the users 102 via a display page that indicates the status. For example, the social network display page 300 can include the status of the relationships with each of the users 102 displayed on the social network display page 300. The biographical data 304, for example, can also display whether the relationship with the user about which the biographical data 304 is displayed has accepted, denied, or is reviewing the data about the relationship or proposed relationship. The status may comprise a written description of the relationship, the time of the relationship, and/or any other details about the relationship.

Details of a social map generated based on the relationship the users 102 have with one another may also be displayed via the social network display page 300. For example, a social map that shows details about a relationship between the user B 102B and the user A 102A may be generated, displayed, and or accessed by the users 102.

The social network display page 300 can also display the users 102 in an ascending or descending order according to a chronology associated with the relationships the users 102 have with other users. For example, the user N 102N may be displayed before the user B 102B in a listing requested by the user A 102A because the user A 102A has known the user N 102N for a longer period of time than the user B 102B. The users 102 can be displayed according to common groups, association with common events, situations, or occurrences, and so forth.

Referring now to FIG. 5, a flow diagram of an exemplary process for social mapping is illustrated. At step 502, data

about one or more social network members is received. The social network members may comprise the users **102** described herein, such as the user A **102A**, the user B **102B**, and/or the user N **102N**. Any number of users may comprise the social network members. As discussed herein, the users **102** can utilize the social networking website associated with the social network engine **106** to access and/or provide data about other of the users **102**.

At step **504**, a first social network member is allowed to identify at least one second social network member to establish a relationship. For example, the user A **102A** can select the user B **102B** with whom the user A **102A** wants to establish a relationship. The user A **102A** can select the user B **102B** from a list, such as the list displayed via the social network display page **300** discussed herein.

At step **506**, the data is sent to the second social network member about the first social network member based on the identification. For example, once the user A **102A** selects the user B **102B** for establishing a relationship, the user A **102A** may be directed to a social editor page **400** generated by the social relationship module **204**. The social relationship editor module **204** can, optionally, pre-populate the social editor page **400** with data already stored by the relationship storage module **206** about the user A **102A** and the relationship user A **102A** may already have established or partially established with the user B **102B**, for example.

At step **508**, input is received from the second social network member in response to the data. For example, the user B **102B** may confirm the data provided by the user A **102A** utilizing the social editor page **400**. The user B **102B** may also deny that the data is accurate or deny the relationship generally, edit the data, add to the data, and so forth. Any action taken by the user B **102B** in response to receiving the data regarding the relationship or proposed relationship from the user A **102A** is within the scope of various embodiments.

At step **510**, the relationship is confirmed based on the input in order to map the first social network member to the at least one second social network member. According to some embodiments, the social network engine **106** can determine whether or not to confirm the relationship before the relationship is confirmed. The social relationship editor module **204** can confirm the relationship, for example, based on the input from the user B **102B**. The confirmation may comprise establishing that the relationship data is accurate, editing the relationship data, denying the relationship data, adding to the relationship data, and/or optionally requesting further confirmation from the user A **102A**.

According to some embodiments, the relationship data is mapped to the user B **102B** once the user B **102B** confirms the relationship data as accurate. In other words, if the user B **102B** confirms that the user B **102B**, indeed, has a relationship of some type with the user A **102A**, the relationship details can be added to a profile associated with the user B **102B**, for example.

The user A **102A** and/or the user B **102B** may also be asked if privacy settings should be modified in response to the newly established relationship. For example, the user B **102B** may confirm the relationship with the user A **102A**, but may only want the user A **102A** to have access to the data about the user B **102B** that the user B **102B** allows the users **102** within a specific community or group to access. The privacy settings can be modified at any time. For example, a privacy settings module (not shown) may be associated with the social network engine **106** for specifying the privacy settings for each of the users **102** with respect to which data about the users **102** each other of the users **102** can access.

According to other embodiments, the relationship data may be presented or displayed according to the relevance of the relationship data to online or offline interactions between the users **102**, to timeframes based on online or offline interactions, and so forth. For example, the social network engine **106** can suggest other of the users **102** with whom the user A **102A** may want to form a relationship based on the fact that those other users **102** attended the same school, at the same time.

Predictive tools for forecasting which of the users **102** will establish relationships, analytical tools for determining the nature and influence the users **102** have on one another, and any other tools may be developed based on the relationship data. For example, the social network engine **106** can identify stories about the user B **102B** that the user A **102A** will find most interesting based on the relationship data.

Further, the users **102** can be grouped according to the established relationships. The groupings can be utilized to display various types of information to the users **102**, suggest other of the users **102** with which relationships should be established, and so forth.

While various embodiments have been described above, it should be understood that they have been presented by way of example only, and not limitation. For example, any of the elements associated with the social network engine **106** may employ any of the desired functionality set forth hereinabove. Thus, the breadth and scope of a preferred embodiment should not be limited by any of the above-described exemplary embodiments.

What is claimed is:

1. A method comprising:

receiving profile data about a plurality of social network members, each member having a plurality of established relationships with other members of the social network; identifying an established relationship between a first member and a second member of the social network, the established relationship represented in the profile data about the plurality of social network members and indicating the first member and second member are directly connected based on a mutual self-declared relationship between the first and second members on the social network;

receiving details about the established relationship between the first member and the second member of the social network from one of the first member and the second member, the details comprising at least a relationship type that characterizes the nature of the established relationship between the first member and the second member;

associating one or more privacy settings with the established relationship, wherein the privacy settings are provided by one of the first member and the second member and govern who can access the details about the established relationship;

identifying a grouping of members, defining a subset of members of the social network, that includes the first member and the second member based on a common characteristic;

mapping the established relationship between the first member and the second member based on the grouping of members;

selecting a third member for the first member to establish a relationship with based on the grouping that includes both the first member and the second member, the grouping that includes the first member and the second member also including the third member, the third member being a member of the grouping and possessing the

9

common characteristic, the third member not having an established relationship with the first member, and the third member not having an established relationship with the second member; and

displaying on a social network display page a suggestion to establish a relationship on the social network with the third member.

2. A non-transitory computer readable medium storing computer program instructions, the computer program instructions being executable by a processor, the computer program instructions comprising instructions for:

receiving profile data about a plurality of social network members, each member having a plurality of established relationships with other members of the social network; identifying an established relationship between a first member and a second member of the social network, the established relationship represented in the profile data about the plurality of social network members and indicating the first member and second member are directly connected based on a mutual self-declared relationship between the first and second members on the social network;

receiving details about the established relationship between the first member and the second member of the social network from one of the first member and the second member, the details comprising at least a relationship type that characterizes the nature of the established relationship between the first member and the second member;

associating one or more privacy settings with the established relationship, wherein the privacy settings are provided by one of the first member and the second member and govern who can access the details about the established relationship;

identifying a grouping of members, defining a subset of members of the social network, that includes the first member and the second member based on a common characteristic;

mapping the established relationship between the first member and the second member based on the grouping of members;

selecting a third member for the first member to establish a relationship with based on the grouping that includes both the first member and the second member, the grouping that includes the first member and the second member also including the third member, the third member being a member of the grouping and possessing the common characteristic, the third member not having an established relationship with the first member, and the third member not having an established relationship with the second member; and

displaying on a social network display page a suggestion to establish a relationship on the social network with the third member.

3. The method of claim 1, wherein the details about the established relationship are input by one of the first member and the second member and the details are verified by the other of the first member and the second member before the relationship between the first member and the second member is established.

4. The method of claim 1, wherein the relationship type comprises how the first member and the second member know each other.

5. The method of claim 1, wherein the details further comprise at least one of a group consisting of where the first member and the second member lived together, and where the first member and the second member worked together.

10

6. The method of claim 1, further comprising receiving a modification to the details about the established relationship between the first member and the second member from one of the first member and the second member.

7. The computer readable medium of claim 2, wherein the details about the established relationship are input by one of the first member and the second member and the details are verified by the other of the first member and the second member before the relationship between the first member and the second member is established.

8. The computer readable medium of claim 2, wherein the relationship type comprises how the first member and the second member know each other.

9. The computer readable medium of claim 2, wherein the details further comprise at least one of a group consisting of where the first member and the second member lived together, and where the first member and the second member worked together.

10. The computer readable medium of claim 2, wherein the instructions further comprise instructions for receiving a modification to the details about the relationship between the first member and the second member from one of the first member and the second member.

11. The method of claim 1, wherein displaying comprises displaying to at least one of the first member and the second member.

12. The method of claim 1, wherein displaying comprises displaying to the third member of the social network.

13. The computer readable medium of claim 2, wherein displaying comprises displaying to at least one of the first member and the second member.

14. The computer readable medium of claim 2, wherein displaying comprises displaying to the third member of the social network.

15. The method of claim 1, wherein displaying comprises displaying on a social network display page all of the members who are included in the same grouping as both of the first member and the second member.

16. The computer readable medium of claim 2, wherein displaying comprises displaying on a social network display page all of the members who are included in the same grouping as both of the first member and the second member.

17. The method of claim 1, further comprising displaying the details about the established relationship.

18. The computer readable medium of claim 2, wherein the instructions further comprise instructions for displaying the details about the established relationship.

19. The method of claim 1, wherein the details about the established relationship includes a status of the established relationship.

20. The computer readable medium of claim 2, wherein the details about the established relationship includes a status of the established relationship.

21. The method of claim 1, further comprising displaying on a social network display page another member, in addition to the third member, in the grouping shared by both the first member and second member of the social network.

22. The computer readable medium of claim 2, wherein the instructions further comprise instructions for:

displaying on a social network display page an additional member, in addition to the third member, in the grouping shared by both the first member and second member of the social network.

23. The method of claim 1, wherein the common characteristic is a self-declared social attribute on the members' profiles.

24. The method of claim 1, wherein selecting the third member comprises identifying the third member from the subset of members defined by the grouping based on a projected measure of influence of the third member to the first member.

5

25. The method of claim 24, wherein the projected measure of influence of the third member to the first member is determined based on a relevance to the first member of social networking content posted by the third member accessible to the second member but is inaccessible to the first member based on access privileges for the social content.

10

26. The method of claim 24, wherein the projected measure of influence of the third member on the first member is determined based on a duration of time during which the second and third members were connected and a duration of time during which the first and second members were connected.

15

27. The method of claim 24, wherein the projected measure of influence of the third member to the first member is determined based on a strength of connectivity between the second and third members and a strength of connectivity between the first and second members.

20
